PROBLEMS

Problem 2.1. Test the following differentials for exactness. For those cases in which the differential is exact, find the function u(x, y).

(a) $du_a = \frac{1}{x^2+y^2} + \frac{1}{x^2+y^2}$. (b) $du_a = (y - x^2)dx + (x + y^2)dy$.

(c) $du_c = (y - x^2)dx + (x + y^2)dx$ (c) $du_c = (2y^2 - 3x)dx - 4xy dy$.

Froblem 2.2. Consider the two differentials (1) $du_1 = (2xy + x^2)dx + x^2dy$ and ($du_2 = y(x - 2y)dx - x^2dy$). For both differentials, find the change in u(x, y) between two points, (a, b) and (x, y). Compute the change in two different ways: (a) Integrate alore the path (a, b) = (x, b) = (x, y), and (b) integrate alore the path (a, b) = (a, y).

Problem 2.3. Electromagnetic radiation in an evacuated vessel of volume V^{\pm} equilibrium with the walls a temperature T (back holy radiation) behaves like a gas of photons having internal energy $U - aVT^{\pm}$ and pressure $P - (1/3)aT^{\pm}$, where a is Stefan's constant. (a) Plot the closed curve in the PV-P plane for a Cannot cycle using blackbody radiation. (b) Derive explicitly the efficiency of a Carnot engine which uses

Problem 2.4. A Carnot engine uses a paramagnetic substance as its working substance. The equation of state is M = (DBHT), where M is the magnetization, H is the magnetic field, in the sumber of molecule, D is a constant determined by the pope of substance, and T is the temperature. (a) Show that the internal energy U, and therefore the heat capacity C_{ij} can only depend on the temperature and on the magnetization. Let us assume that $C_{ij} = C = \text{constant}$. (b) Sketch a typical Carmot cycle in the M-H plane. (c) Compare the truth least absorbed and the total twork shows by the Carmot cycle in the M-H plane. (c) Compare the truth least absorbed and the total review C_{ij} of the C_{ij} compared to C_{ij} and C_{ij} is the C_{ij} constant.

2.1) a)
$$du_{x} = -\frac{y}{x^{2} + y^{2}} dx + \frac{x}{x^{2} + y^{2}} dy$$

$$\frac{2}{2y} \left(-\frac{y}{x^{2} + y^{2}} \right) = \frac{-\left((x^{2} + y^{2})(1) - (2y)(y) \right)}{\left(x^{2} + y^{2} \right)^{2}}$$

$$= \frac{-x^{2} + y^{2}}{\left(x^{2} + y^{2} \right)^{2}}$$

$$\int \frac{-y}{x^{2} + y^{2}} dy = x \left(\frac{1}{y} + x^{-1} \left(\frac{y}{y} \right) \right)$$

$$\int \frac{x}{x^{2} + y^{2}} dy = x \left(\frac{1}{y} + x^{-1} \left(\frac{y}{y} \right) \right)$$

$$\int \frac{x}{x^{2} + y^{2}} dy = x \left(\frac{1}{y} + x^{-1} \left(\frac{y}{y} \right) \right)$$

$$\int \frac{x}{y^{2} + y^{2}} dy = x \left(\frac{1}{y} + x^{-1} \left(\frac{y}{y} \right) \right)$$

$$\int \frac{2}{2y} \left(y - x^{2} \right) dx + \left(x + y^{2} \right) dy$$

$$\int \frac{2}{2y} \left(y - x^{2} \right) = 1$$

$$\int \frac{2}{2y} \left(x + y^{2} \right) = 1$$

$$\int \frac{2}{2y} \left(x + y^{2} \right) dy = x \left(\frac{1}{3} + x^{3} \right)$$

$$\int \frac{2}{3y} \left(x + y^{2} \right) dy = x \left(\frac{1}{3} + x^{3} \right)$$

$$\int \frac{2}{3y} \left(x + y^{2} \right) dy = x \left(\frac{1}{3} + x^{3} \right)$$

$$\int \frac{2}{3y} \left(x + y^{2} \right) dy = x \left(\frac{1}{3} + x^{3} \right)$$

2.2)
$$du_{1} = (2 \times y + x^{2}) dx + x^{2} dy$$

1.) $(a_{1}b) + (x_{1}y)$
 $a_{2}b + x^{2}b + x^{2}b + x^{2}b + x^{2}b + x^{2}b$
 $= x^{2}y + \frac{1}{3}x^{3} - a^{2}y - \frac{1}{3}a^{3} + x^{2}y - x^{2}b$
 $= x^{2}b + \frac{1}{3}x^{3} - a^{2}b - \frac{1}{3}a^{3} + x^{2}y - x^{2}b$
 $= \frac{1}{3}x^{3} + x^{2}y - a^{2}b - \frac{1}{3}a^{3}$
 $a_{2}b + \frac{1}{3}x^{3} - a^{2}b + \frac{1}{3}x^{3}$
 $a_{3}b + x^{2}y - a^{2}b - \frac{1}{3}a^{3}$
 $a_{4}b + \frac{1}{3}x^{3} - a^{2}b - \frac{1}{3}a^{3}$
 $a_{5}b + \frac{1}{3}x^{3} + x^{2}y - a^{2}b - \frac{1}{3}a^{3}$
 $a_{7}b + \frac{1}{3}x^{3} + x^{2}y - a^{2}b - \frac{1}{3}a^{3}$
 $a_{7}b + \frac{1}{3}x^{3} + x^{2}y - a^{2}b - \frac{1}{3}a^{3}$
 $a_{7}b + \frac{1}{3}x^{3} + x^{2}y - a^{2}b - \frac{1}{3}a^{3}$

$$\int_{X+y^{2}} dy = xy + \frac{1}{3}y^{3}$$

$$\int_{B} \frac{1}{3}y^{3} - \frac{1}{3}x^{3}$$

c.)
$$\forall u_r = (2y^2 - 3x) \forall x - 4xy \forall y$$

 $\frac{2}{2y}(2y^2 - 3x) = 4y \times$
 $\frac{2}{2y}(-4xy) = -4y \times$

$$= \frac{0^{2} y - \alpha^{2} b + x^{2} y + \frac{1}{3} x^{3} - 9^{2} y - \frac{1}{3} \alpha^{3}}{2}$$

$$= \frac{1}{3} x^{3} + x^{2} y - \alpha^{2} b - \frac{1}{3} \alpha^{3}}{2}$$

$$= \frac{1}{3} x^{3} + x^{2} y - \alpha^{2} b - \frac{1}{3} \alpha^{3}}{2}$$

$$2.) \quad du_{2} = y (x - 2y) dx - x^{2} dy$$

$$b.) \quad (u_{1} b) \Rightarrow (x_{1} b) \Rightarrow (x_{1} y)$$

$$\int_{0}^{x} y (x - 2y) dx - \int_{0}^{y} x^{2} dy$$

$$= \frac{1}{2} y x^{2} - 2 y^{2} x - \frac{1}{2} y x^{2} + 2 y^{2} \alpha - x^{2} y + x^{2} b$$

$$= \frac{1}{2} 6 x^{2} - 2 b^{2} x - \frac{1}{2} 6 a^{2} + 2 6^{2} \alpha - x^{2} y + x^{2} b$$

$$= \frac{3}{2} x^{2} b - x^{2} y - 2 b^{2} x - \frac{1}{2} 6 a^{2} + 2 6^{2} \alpha$$

$$b.) \quad (u_{1} b) \Rightarrow (u_{1} y) \Rightarrow (x_{1} y)$$

$$y$$

$$\int_{0}^{x} - x^{2} dy + \int_{0}^{y} y (x - 2y) dx$$

$$= -x^{2} y + x^{2} b + \frac{1}{2} y x^{2} - 2 y^{2} x - \frac{1}{2} y a^{2} + 2 y^{2} \alpha$$

$$= -x^{2} y + \alpha^{2} b + \frac{1}{2} y x^{2} - 2 y^{2} x - \frac{1}{2} y a^{2} + 2 y^{2} \alpha$$

$$= -x^{2} y + \alpha^{2} b + \frac{1}{2} y x^{2} - 2 y^{2} x - \frac{1}{2} y a^{2} + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} \alpha$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} a$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b + 2 y^{2} a$$

$$= \frac{3}{2} a^{2} y + \frac{1}{2} y x^{2} - 2 y^{2} x + \alpha^{2} b$$

The answers above demonstrate how the integrals of exact differentials have path independence. Meaning, the path taken does not affect the answer, all that matters is the end points.

We can also look at this through Stokes' theorem. Given an orthogonal coordinate system and function, we can write the following.

$$F = \frac{\partial f}{\partial q_1} \hat{q}_1 + \frac{\partial f}{\partial q_2} \hat{q}_1 + \dots + \frac{\partial f}{\partial q_3} \hat{q}_3$$

$$\nabla F = \frac{\partial f}{\partial q_1} \hat{q}_1 + \frac{\partial f}{\partial q_2} \hat{q}_1 + \dots + \frac{\partial f}{\partial q_3} \hat{q}_3$$

$$\nabla F \cdot \partial q_1 = \frac{\partial f}{\partial q_1} \partial q_1 + \frac{\partial f}{\partial q_2} \partial q_2 + \dots + \frac{\partial f}{\partial q_3} \partial q_3 = \partial F^{\perp}$$

$$\int_{i}^{f} \int F = \int_{i}^{f} \nabla F \cdot \partial q_1 = F(f) - F(i)$$
Reiterate path independence
$$\frac{Stokes}{\nabla F \cdot \partial q_3} = \int_{i}^{f} (\nabla \times \nabla F) \cdot \partial \alpha = 0$$

$$\sum_{i}^{g} \sum_{j=1}^{g} (\nabla \times \nabla F) \cdot \partial \alpha = 0$$

$$\sum_{j=1}^{g} \sum_{j=1}^{g} (\nabla \times \nabla F) \cdot \partial \alpha = 0$$

$$\sum_{j=1}^{g} \sum_{j=1}^{g} (\nabla \times \nabla F) \cdot \partial \alpha = 0$$

$$\sum_{j=1}^{g} \sum_{j=1}^{g} (\nabla \times \nabla F) \cdot \partial \alpha = 0$$
